

CONCEPT PAPER — THREE OF THREE

A website worth showing people, for N\$ 399 a month.

Most Namibian businesses have a Facebook page and no website, because a website has always meant a quote, a project and a person who disappears. We generate the site instead of building it by hand — one price covering the build, the hosting, the domain and the changes afterwards — and where the business has rooms or seats to sell, its own site shows live availability and prices from our booking system.

HOW TO READ THE STATUS MARKS

RUNNING

in production today

BUILT

built and tested, no paying customer on it yet

DESIGNED

decided, not built

This is the youngest of the three product lines, and the marks are correspondingly mixed.

Generated, not hand-built — which is the only way the price works

At N\$ 399 a month a bespoke site per customer does not survive the margin, and everybody who has tried ends up either charging five times as much or abandoning the customer after launch. So the product is a small kit of very good standard modules, assembled automatically — and the quality of that one template is the product, not the number of options in it.

The owner makes no design decision, and gets a finished site anyway

Sticky navigation, a full-bleed hero, alternating image-and-text sections, prices, opening hours, a map, an enquiry form and a proper legal footer — laid out in the order that suits the kind of business. Nothing to choose, nothing to configure, nothing left half-finished.

WHY NOT JUST INSTALL WORDPRESS FOR EACH CUSTOMER

It was the obvious answer and it was rejected deliberately. A WordPress per owner is far more functionality than the purpose needs, a permanent security exposure across dozens of instances, and an update treadmill that costs more per month than we charge. **Its flexibility is exactly what makes it expensive to operate.** Our kit is the opposite trade — the owner cannot introduce code of any kind, so the restriction that makes the price possible is the same one that makes it safe (page 5).

WHAT ONE MONTHLY FEE COVERS

The site itself

Designed, built, filled in with the business's own words and photographs, and live on a real address.

The domain

We register it and we renew it. The customer keeps it if they leave — it is theirs, not a hostage.

Hosting and certificates

The same infrastructure the travel platform runs on, with the security certificate issued and renewed without anybody asking.

Changes afterwards

New prices, new photographs, a changed opening time — a message to us and it is done. The owner can also do it themselves.

Findable

Set up on Google Maps and a Google Business Profile. Where anyone ranks in a search result is not something we will promise.

No lock-in

Cancellable at any time, no contract term. Content and domain belong to the business.

The website owns its content. Full stop.

The tempting design reads the website live out of the business's listing on the travel platform — one source of truth, no duplication. We deliberately did not do that, and the reasoning is worth reading, because it is the decision the whole product line rests on.

Two different couplings on purpose. Content is **imported once and then belongs to the website**; availability and prices are **read live every time and never stored here**, because a stale copy of a price is a booking somebody has to honour.

THREE REASONS IT IS BUILT THIS WAY

Customers with no listing	A workshop or a shop will never have one. If the website read from a listing it would have no source for them at all, and two separate data paths would be double the build and double the testing for one product.
The ownership promise	We tell a customer the website and its content are theirs. Content read live out of somebody else's record — and disappearing when that record does — is not theirs, whatever the contract says. The architecture has to make the promise true.
Rights on every field	The travel platform tracks where each description and each photograph came from. Only material we may actually hand over is imported: third-party directory content is never copied, and material we hold for our own prospecting is marked and blocks publication until it is replaced.

WHICH IS ALSO WHY IT IS NOT ONLY FOR LODGES

The kit is sold just as happily to a restaurant, a workshop or a shop with nothing tourism-bookable about it. **A customer with no listing on the travel platform is an equally ranked main case**, and gets the same kit starting from empty blocks rather than a cut-down version.

One click makes a real site, in seconds

Not a template preview and not a wireframe — a complete, responsive website with the business's own name, words, photographs, address, map and opening hours already in it, ready to be corrected rather than ready to be started.

Step 1 takes seconds. Step 6 takes as long as the internet takes to agree the domain has moved — and the subdomain works throughout.

Re-running the generator **refreshes what it wrote and never touches what has been edited since** — so a site can be regenerated without losing a word anybody typed.

THE KIT

BUILT

Twelve module types, assembled in the order that suits the business. A module with no content behind it does not appear as an empty box — it simply is not there, and the panel says it needs filling.

- ◆ Opening screen — full-bleed photograph, a line, a call to action
- ◆ Sticky navigation — and a proper menu on a phone
- ◆ Introduction — what this place is, in the owner's words
- ◆ Image and text sections, alternating
- ◆ Gallery — the business's own photographs
- ◆ Highlights — what makes it worth the drive
- ◆ Rooms, units or vehicles — with prices
- ◆ Facilities, and opening hours
- ◆ Map and directions, contact and social media
- ◆ Enquiry form — which reaches the owner, not a void
- ◆ Booking — live availability, where there is something to sell
- ◆ Legal footer — privacy, legal notice, copyright

FAST ENOUGH TO FEEL EXPENSIVE

The target is a phone on a weak Namibian mobile network, so speed is an architectural decision rather than an optimisation afterwards. The sites carry **no front-end framework at all** — server-rendered, inlined styles, about fifteen lines of JavaScript, images sized on demand, and fully readable with scripting switched off. A page carrying every module at once measures around 18 KB against a ceiling of 60 KB, and a test fails the build if that ceiling is crossed.

Hosting other people's businesses is a responsibility, not a hosting bill

Dozens of small sites on one server, each one somebody's livelihood, each one carrying content we did not write. Two things follow: the owner must not be able to introduce code, and the part of the system that can take the server down must not be reachable from the part that serves web requests.

A CUSTOMER'S OWN DOMAIN GOING LIVE

The application

Takes the domain from an admin field, hands over copy-and-paste DNS instructions, then every five minutes asks one question: does this name point at us yet? It writes down what it saw.
It can observe. It cannot act.

A separate privileged process

Asks the application which domains are ready, issues the certificate, writes the web-server configuration in one atomic step, reloads, and reports back.

It runs on a timer, not on a request.

THE WALL

A web process allowed to run certificate tooling and rewrite server configuration is a web process with root. One bad configuration file takes every si

Both the customer's bare domain and its *www* form have to resolve before a certificate is attempted — a certificate covering half of what the customer prints on a business card fails in front of a guest instead of here. And **a domain that is already live is never re-checked**, so a momentary DNS hiccup cannot take a website off the air.

What an owner cannot do

RUNNING

No free HTML block, no script, no iframe, no third-party embed, no file upload other than an image that is checked. Formatted text is filtered against a list of permitted markup on the server. A paste out of a word processor cannot put anything executable on their own site.

That restriction is not a limitation we apologise for. It is the reason one person can safely operate a hundred of these.

The legal foot

BUILT

Privacy, legal notice and copyright line on every site. We write the first version and the business owns and edits all three, then confirms them when the site is published.

The system does not generate legal advice. What it generates is a factual description of *how this website works* — what the form collects, where it goes, that there is no tracking — which we can state because we built it. Everything about the business itself comes off their own record, so a missing address produces a shorter page rather than an invented one.

WHERE THE LIABILITY LINE IS DRAWN

The customer answers for the content; we answer for the hosting and the technology. The technical side already supports that line rather than merely asserting it: because the owner cannot introduce code, everything they publish is exactly what they typed into structured fields — and who published what, and when, is recorded. There is a route for complaints and a way to take a site or a single element offline at short notice.

The part no template shop can offer

A lodge's own website normally shows a contact form and a promise to reply. If the business runs on our booking system, its own site can show what is genuinely free tonight and what it costs — read live from the same calendar the front desk works in, never a copy.

WHAT A SITE CAN DO WITH THE BOOKING SYSTEM BEHIND IT

Live availability and prices

BUILT

Read directly from the property's own calendar and rate plan, with the season, the occupancy rules and the taxes included. Never cached, because a cached price is a booking somebody has to honour at the wrong number.

The enquiry form

BUILT

Creates a real request in the same pipeline the travel platform uses — so the owner gets the mail with one-click confirm and decline links, and the visitor gets an answer either way. An accommodation is asked for arrival and departure; a restaurant or an activity for a date and a time.

Finishing the booking

BUILT

The site quotes, and the guest completes the booking on namibway.com. That hand-over is what exists today and it is what we say, not more.

Booking without leaving

DESIGNED

Decided and not built: the guest stays on the business's own site throughout, with a sign-in that works across two different domains. That is a real piece of engineering, not a button, and it is named here rather than implied.

Five languages

DESIGNED

Decided — English, German, Dutch, French and Spanish, matching the travel platform. Today the sites carry the database structure for a second language and nothing else: no switcher, no per-language address. The foundation, not the feature.

The subscription

DESIGNED

The states below are decided; collection is manual invoicing until a recurring payment method exists in this market. The owner's own create-a-website button stays locked until something knows whether a customer is paying.

THE SUBSCRIPTION, AND WHAT HAPPENS TO THE LIVE SITE IN EACH STATE — **DESIGNED, NOT BUILT**

A confirmed booking is never affected by the subscription behind the website it came from. The booking lives in the booking system, and the business keeps its calendar, its guests and its invoices whatever happens to the website — those are the free core, and they are not the thing being

The subscription price lives in configuration, never in the code that decides these states — so a change of price, a special arrangement or a tier is a

WHY A TRAVEL PLATFORM IS SELLING WEBSITES AT ALL

Because a lodge's own website is where its direct bookings happen, and a direct booking that runs on our booking system is worth more to both sides than a portal listing. **The website line is a distribution channel for the booking system** — sold on its own merits to businesses that will never book anything, and sold as one continuous offer to those that will.

What we will not tell you

THE LIMITS, PRINTED NEXT TO THE CLAIMS

There is no live customer website. The system generates real sites on real domains with real certificates, and nobody is paying for one yet — so there is no customer to name, no site to link to and no testimonial to quote. Anything showing what a site looks like is our own work.

We cannot promise where anyone ranks in search. Setting a business up on Google Maps and a Google Business Profile is a real and useful thing to have done. It is not the same as being found first, and any supplier who promises you that is selling you something else.

The monthly price is a proposal until it is signed off, and there is no recurring card billing yet — the fee is invoiced by hand until a method exists for this market. **Five languages are decided, not delivered,** and a guest today finishes a booking on namibway.com.

WHAT IS ACTUALLY RUNNING

RUNNING

- ◆ Generated sites from a listing, or from nothing at all
- ◆ Twelve module types and one template, server-rendered
- ◆ Around 18 KB for a page carrying every module
- ◆ Readable with JavaScript switched off
- ◆ An enquiry form that reaches the owner by mail
- ◆ Privacy, legal notice and copyright pages
- ◆ A private preview address for drafts
- ◆ Customer domains, with the certificate issued automatically
- ◆ Live availability and prices from the booking system
- ◆ Editing by us and by the owner, on the same fields
- ◆ Photographs sized on demand for the device asking
- ◆ Rights checks that refuse to publish borrowed material

THE REST OF THIS SET

The whole picture

The overview: three product lines on one shared platform, how each makes the next easier to sell, where the money comes from, and an honest map of what runs and what does not.

Kaia Trip Planning & Listings

The travel platform: a conversational planner that produces one bookable itinerary, and the rule that stops partners being flooded with speculative requests.

Booking & Payment

The lodge-facing system a website's booking module reads from: the occupancy calendar, rate plans, the folio, payments and numbered invoices.

Send us a business that needs a website

We will generate a draft for them and show it — no charge, no obligation, and nothing published until the owner has seen it and said yes. That is the whole sales process, and it is deliberately shorter than a quote.

NAMIBWAY.COM
